

Protect Data From

- Physical Failures
- System Faults
- Virus Attacks
- OS Corruptions
- User Negligence

SecuraNET BD DataSAFE is a data loss prevention utility, once installed is designed to revive the data back. It saves the critical images of the disk and at regular intervals updates. DataSAFE comes into action when there is a data loss or a system failure by calculating the system parameters automatically and gets back the data.

BD DataSAFE Operation

- Recovery Agent will backup the;
 - i) system files,
 - ii) configuration files,
 - iii) application files and
 - iv) the user files onto the recovery partition.
- At pre-set time intervals or pre-set actions/events, the data is streamed to the storage partition.
- In case of media failure, the recovery partition will automatically boot the system and recover the system.
- The user can recover files that have been deleted, or updated and rewind/restore to the contents to a pre-determined time period.
- User can rewind/restore system/configuration files to a previous checkpoint.
- In case of application failure, the system reinstalls all the critical application files, to automatically recover from the application fault/failure.

System can be configured to provide a second level recovery media on a CD or another computer on the network.
